

Quick Start

Build your first label in five minutes

LA Peptides Universal Label System

Quick Start

What this is: a portable, brand-neutral vial-label design engine. Supply a **brand profile** (logo, colors, fonts) and a **product profile** (peptide name, strength, LOT, UBD) and the engine generates a finished, print-ready label — no redesign, ever.

1. Install (once)

```
cd LA-Peptides-Universal-Label-System
npm install
```

Requires Node.js 18+. Nothing else — no accounts, no external services, no network access needed to build.

2. Build the included examples

```
npm run build:master          # the neutral master template itself (all
                             # placeholders)
npm run build:profile-example # a full example brand + product pair, reskinned
```

Each writes to `.build/<name>/`:

File	What it's for
<code>label.svg</code>	Editable source — open in Illustrator/Figma/Inkscape/Canva
<code>label-preview.png</code>	300dpi raster preview
<code>label-print.pdf</code>	Exact-size (1.77"×0.77") vector print PDF
<code>manifest.json</code>	What theme/profile built this, plus PDF-size verification
<code>assets/</code>	Every logo/QR/icon asset the SVG references

3. Generate a label for a new brand partner

1. Copy `brand-profiles/default.brand-profile.json` → `brand-profiles/your-partner.brand-profile.json`. Set their logo, name, tagline, colors, fonts.

2. Copy `product-profiles/example.product-profile.json` → `product-profiles/your-product.product-profile.json` . Set the peptide name, strength, LOT, UBD, and COA URL.
3. Build, then review `label-preview.png` and hand off `.build/your-product.zip` — it's self-contained:

```
node scripts/build-profile.js --brand brand-profiles/your-partner.brand-profile.json --product product-profiles/your-product.product-profile.json --out .build/your-product --zip
```

That's the entire workflow. No part of `master-label.svg` needs to change for a new brand or a new product.

Where to go next

- Not sure what a field or theme token does? → `FIELD-ID-REFERENCE` is in `DEVELOPER-GUIDE.md` ; token map is in `README.md` → "Theme tokens"
- Printing on an Epson ColorWorks? → `DEVELOPER-GUIDE.md` "Export a production-ready PDF"
- Onboarding a new brand partner (non-technical)? → `BRAND-PARTNER-GUIDE.md`
- Reviewing/printing a finished batch (non-technical)? → `PRODUCTION-GUIDE.md`
- Building this into a website, app, or API? → `RENDERING-SPEC.md` and `DEVELOPER-GUIDE.md`
- What gets checked before a build succeeds? → `VALIDATION-RULES.md`
- Full technical detail? → `README.md`
